Mean 8.278; Variance 4.498; scale 1.841 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 22; Page 74; 183pp; Japanese.

This sequence encodes full length osteoclastogenesis inhibitory factor (OCIF) 4. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                    22-APR-1997 (first entry)

Claim 91; Page 152-161; 183pp; Japanese.

The sequences given in T33182-83 represent fragment of the genomic DNA encoding the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 50 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   419

New human tumour necrosis factor receptor - used to develop prods.

To treating e.g. tumours, infection, auto:immune disease, graft
rejection, cytocoxicity or inflammation

Claim 1; Fig 1; 59pp: English.

Claim 1; Fig 1; 59pp: English.

Claim 2; Fig 1; 59pp: English.

Claim 3; Fig 1; 59pp: English.

Claim 4; Fig 1; 59pp: English.

Claim 5; Fig 1; 59pp: English.

Claim 6; Fig 1; 59pp: English.

Claim 1; Fig 1; 59pp: English.

Claim 1; Fig 1; 59pp: English.

Claim 1; Fig 1; 59pp: English.

Claim 1; Fig 1; 59pp: English.

The receptor may be used for screening for antagonists and agonists of the receptor and for lighted for the receptor. Such agonists may be used to inhibit the growth of tumours, to stimulate cellular captonist, to required erowine and anti-viral response, to required erowine provide response and anti-viral autofunne diseases, inflammation, septic shock, to inhibit graft.

Control of the receptor and to prevent apoptosis.

Control of the receptor and the provide response and anti-viral autofunne diseases, inflammation, septic shock, to inhibit graft.

Control of the receptor and the provide response and anti-viral autofunne diseases, inflammation, septic shock, to inhibit graft.
                                                                                                                                                                                                                                                                                                                                                   ö

This sequence encodes full length osteoclastogenesis inhibitory factor (OCIF) 5. The OCIF of the invention has a molecular weight by SDS-PAGE 06 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treamment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                             121 tgtgacaaatgtcctcctggtacctacctaaaacaacatgtacagcaaagtggaagac 180

osteo clastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CCR4 in which amino acids 123-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kb under reducing conditions and 120 kb under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. This sequence is not given in the specification and is derived from the protein sequence and the wild type OCIF CDNA sequence given in T36685. Sequence 432 BP; 116 Å; 117 C; 106 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ctatactgcagccccgtgtgcaaggagctgcagtacgtcaagcaggagtgcaatcgcacc 300

The protein is adsorbed onto
                                                                                                                          cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
This sequence encodes a mutated version of the full length osteoolastogenesis inhibitory factor (OOIF) of the invention. This sequence encodes OCIF-CBB in which amino acids 167-380 of the mature protein have been deleted. These amino acid changes have been caused by the introduction of a restriction site. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed ont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22-APR-1997 (first entry)

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes a mutated version of the invention. This sequence encodes OCIF-CDD1 in which amino acids 177-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 0 KD under reducing conditions and 120 KD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. This sequence is not given in the specification and is derived from the protein sequence and the wild type OCIF CDNA sequence given in T36685. Sequence 594 BP; 176 A; 152 C; 136 G; 130 T;
                                                                                                                                                                                                                                                                                                                                       ö

for bone resorption control, esp. treatment of osteoporosis
Claim 66. Page 145; 183p; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DD2 in which amino acids 252.380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 50 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

           This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CSph in which amino acids 298-380 of the mature protein have been deleted and replaced by Ser-Leu-Asp. These amino acid changes have been caused by the introduction of a restriction site.

The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kb under reducing conditions and 120 kb under non-reducing conditions. The protein is adsorbed onto cation exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-AFR-1997 (first entry)

Claim 54, Page 141-142; 185pp, Japanese.

This sequence encodes a mutated version of the full length osteoclassis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DDD1 in which amino acids 178-252 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

This sequence encodes mutter derivation of the full length of steedlastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes Total mutter actor (OCIF) of the invention. This sequence encodes OCIF-DDD2 in which amino acids 253-356 of the mature protein have been deleted. The OCIF of the invention has a molecular non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

This sequence encodes a mutated version of the full length obsteodlastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CC in which amino acids 331-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                ô

osteo clastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CR4 in which amino acids 123-164 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. ocIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption e.g. osteoporosis.

sequence encodes OCIF-CBst in which Gln371 is substituted with Leu and amino acids 373-380 of the mature protein have been deleted. These amino acid changes have been caused by the introduction of a restriction site. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing on conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the provention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CL in which amino acids 379-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

                                                                                                                                             double-stranded conva was size selected, ligated to Eco RI adapters (pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT/T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 53. Library constructed by Bento Soares and M. Fatima Bonaldo. The adult brain RNA was provided by Dr. Donald H. Gilden. Tissue was acquired 17-18 hours after death which occurred in consequence of a ruptured a ortic aneurysm. RNA was prepared from a pool of tissues representing the following areas of the brain: frontal, parietal, temporal and occipital cortex from the left and right hemispheres, subcortical white matter, basal ganglia, thalamus, cerebellum,

The mRNA sources were 1) 7 day germinated eticlated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                l (bases 1 to 472)

Site_2: EcoRI; The library used for sequencing was a sublibrary derived from a human retina cDNA library.
Inserts from retina cDNA library DNA were isolated,
Inserts from retina cDNA library DNA were isolated,
Inserts from retina cDNA library DNA were isolated,
Into lambda gtl0. Individual plaques were arrayed and
used as templates for PCR amplification, and these PCR
products were used for sequencing."

tabase:

Mean 10.125; Variance 1.771; scale 5.717 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/octe="vector: lambdaZapII; Site_1: Eco R I (5' end); Site_2: Xho I (3' end); Brugia malayi is a lymphatic filarial nematode parasite of humans. Full length cDNA was prepared by long-range RT-PCR from mRNA from L2 larvae of the human filarial nematode parasite Brugia malayi using nematode spliced leader (SL, 5'end) and oligo-d(T) (3' end) primers. The library had an unamplified titre of -1 x 10E6 per ml and -95% of clones have inserts (mean length -900 bp). The library is available from The Filarial Genome Project Resource Center: contact Dr. S.A. Williams, Clark Science Center, Smith College, Northampton, MA 01063 USA phone +1 413 585 3826 fax +1 413 585 3786 email
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

/note-"vector: lambdazapII; Site_1: Eco R I (5' end); Site_2: Xho I (3' end); Brugia malayi is a lymphatic filarial nematode parasite of humans. Full length colls was prepared by long-range RT-PCR from mRNA from L2 larvae of the human filarial nematode parasite Brugia malayi using nematode spliced leader (5L, 5' end) and oligo-d(T) (3' end) primers. The library had an unamplified titre of 1 x 10E6 per ml and -95% of clones have inserts (mean length -900 bp). The library is available from The Filarial Genome Project Resource Center: contact Dr. S.A. Williams, Clark Science Center: Smith College, Northampton, MA 01063 USA phone +1 413 585 3826 fax +1 413 585 3786 email

/note="Vector: lambdaZapII; Site_1: Eco R I (5' end):
Site_2: Xho I (3' end); Brugia malayi is a lymphatic
filatial nematode parasite of humans. Full length cDNR was
prepared by long-range RT-PCR from mRNA from L2 larvae of
the human filatial nematode parasite Brugia malayi using
nematode spliced leader (SL, 5'end) and oligo-d(IT) (3'
end) primers. The library had an unamplified titre of -1 x
10E6 per ml and -95% of clones have inserts (mean length
-900 bp). The library is available from The Filarial
Genome Project Resource Center: contact Dr. S.A. Williams,
Clark Science Center, Smith College, Northampton, MA 01063
